Base task

Original task

Original task: breast_cancer.csv

Label column: Target

Task:

perform logistic regression classification

Evolution-oriented perturbation design

De-identified prior trajectory

- Split train/test and standardize using training statistics
- Fit a linear discriminative classifier
- Inspect confusion behavior and class balance
- Revisit scaling and distribution handling if needed
- Keep inference transformations consistent with training

Transfer-gap hints

Subtype assumption change: Projection → Logistic boundary

Constraint change: Discriminant assumptions → Log-odds model

Metric / decision change: Confusion checks → Probability handling

Perturbed task

- Same target classification problem
- Prior experience in abstracted from
- Explicit transfer gaps present
- Strategy adaptation required

Capability load elicited

E1: Experience abstraction

E2: Strategy transfer

Inject abstract prior experience

Introduce transfer gaps and adaptation demand
